

QUIZ MANAGER

Fundamental Java Project

LAFI KAMEL

USER GUIDE

USER GUIDE

The application is providing the users a GUI platform where the teacher can write and submit a set of questions depending on his chosen topic (in my case I made two topics which are Java(MCQ) and Math (Open question)) and the difficulty level.

However, the student will answer those questions depending on his chosen topic and difficulty level(from the very easy to extremely hard) and then he will get the result (10 points per question = $\frac{?}{100}$) and the evaluation in case he choose the Java topic (MCQ) , but if he choose the open question (Math topic in my application) then after he finishes answering , then it will be exported into a PDF file which will be containing all the open questions with his answers, so then the teacher can evaluate it.

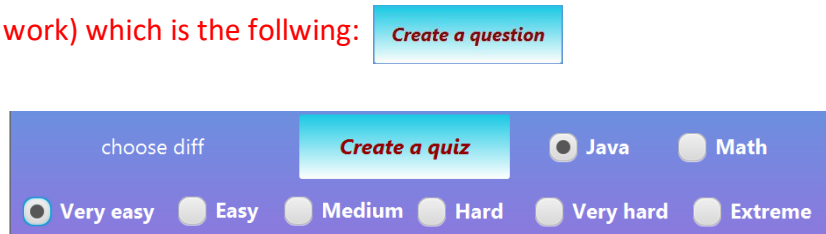

The Teacher

The teacher will perform the following tasks for the MCQ and the Open question:

1. **Creates Questions:** The teacher , has to choose a topic and then he will create a question or add a new question.
In our case, if he chooses the Java topic(which is MCQ) then he will have to write for each question his proposed answers(one of them is right answer), and at least he must **create 10 questions or more.**
If he chooses the open question(Math topic), then he will have to write the question only with one answer (how should be the right answer)
2. **Difficulty Level:** before he starts writing the questions , he has to Assign difficulty level to the questions (which goes from the very Easy to Extreme)

NB: The teacher has to submit at least 10 questions for each difficulty level, otherwise, the student won't be able to attempt the quiz, which means (Technically, the Button "Create a Quiz" will not work) which is the following:

The image shows a button labeled "Create a question" in red text on a light blue background. Below it, there is a section titled "choose diff" with six radio button options: "Very easy" (selected), "Easy", "Medium", "Hard", "Very hard", and "Extreme". To the right of the "Create a question" button, there are two radio button options: "Java" (selected) and "Math".

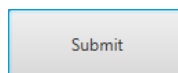

3. Update the Questions, the answer or the difficulty level: Existing questions can be modified or deleted, and the difficulty level can be changed as well.

STEP-1: chose a Topic , choose difficulty level and then click on the Button

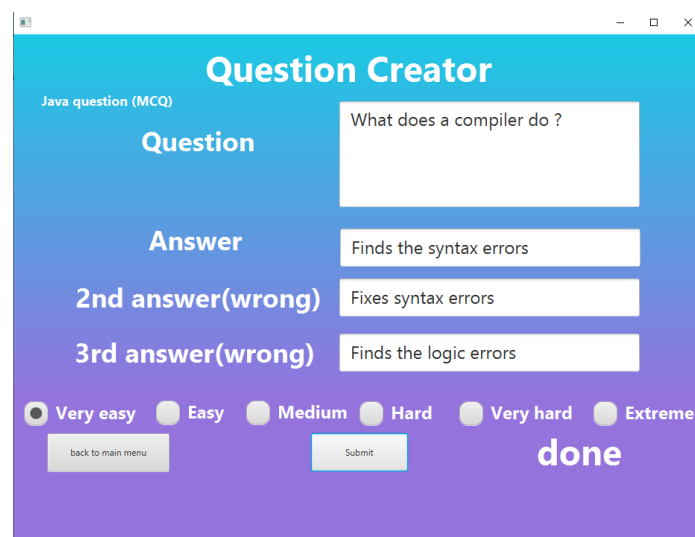

The image shows a window titled "Quiz Creator". It contains a button labeled "Delete/Update Question" in red text on a light blue background. Below it, there is a button labeled "Create a question" in red text on a light blue background. Below that, there is a button labeled "Create a quiz" in red text on a light blue background. At the bottom, there is a button labeled "quit" in red text on a light blue background. To the right of the "Delete/Update Question" button, there are two radio button options: "Java" (selected) and "Math". To the right of the "Create a question" button, there are two radio button options: "Java" (selected) and "Math". To the right of the "Create a quiz" button, there are two radio button options: "Java" (selected) and "Math". Below the "Create a question" button, there are six radio button options: "Very easy" (selected), "Easy", "Medium", "Hard", "Very hard", and "Extreme".

STEP-2: Choose the difficulty level , write the Question and the proposed answers (just one will be right) and then click on the Button

The image shows a button labeled "Submit" in black text on a light blue background.

In here , the Textbox for Answer is where the right answer should be put by the teacher

The image shows a window titled "Question Creator". It contains a section titled "Java question (MCQ)". Below it, there is a section titled "Question" with a text box containing the text "What does a compiler do ?". Below that, there is a section titled "Answer" with a text box containing the text "Finds the syntax errors". Below that, there is a section titled "2nd answer(wrong)" with a text box containing the text "Fixes syntax errors". Below that, there is a section titled "3rd answer(wrong)" with a text box containing the text "Finds the logic errors". At the bottom, there are six radio button options: "Very easy" (selected), "Easy", "Medium", "Hard", "Very hard", and "Extreme". Below the radio buttons, there is a button labeled "back to main menu" in black text on a light blue background. To the right of the "back to main menu" button, there is a button labeled "Submit" in black text on a light blue background. At the bottom right, there is a button labeled "done" in white text on a dark blue background.

STEP-3: When **done** is displayed, that means , the question and its answers have been stored already in the database, So simply the next , is to remove what he has written (**using the backspace of the Keyboard**) and then write the next questions and its proposed answers for each.

The screenshot shows a web application titled "Question Creator" with a blue header and a purple gradient background. The main content area is divided into two columns. The left column contains the following labels: "Question", "Answer", "2nd answer(wrong)", and "3rd answer(wrong)". The right column contains the corresponding input fields: a text area with the question "What will be displayed ? String word = 'Hello'; System.out.println(word);", a text input with "Hello", a text input with "word", and a text input with "none of the above". Below these fields are six radio buttons for difficulty levels: "Very easy" (selected), "Easy", "Medium", "Hard", "Very hard", and "Extreme". At the bottom left are two buttons: "back to main menu" and "Submit". At the bottom right, the word "done" is displayed in a large, bold, white font.

You cannot submit the same question more than one time, otherwise **Try again** will be displayed
As the following:

This screenshot is identical to the one above, showing the same question and answers. However, at the bottom right, instead of the word "done", the text "Try again." is displayed in a large, bold, white font. The "Submit" button is still visible and highlighted with a blue border.

So, in this case all what the user (Teacher) has to do is that he remove by the backspace from the keyboard again , the last question and its proposed answers, and write a new one with its proposed answers and then click on  Button again!

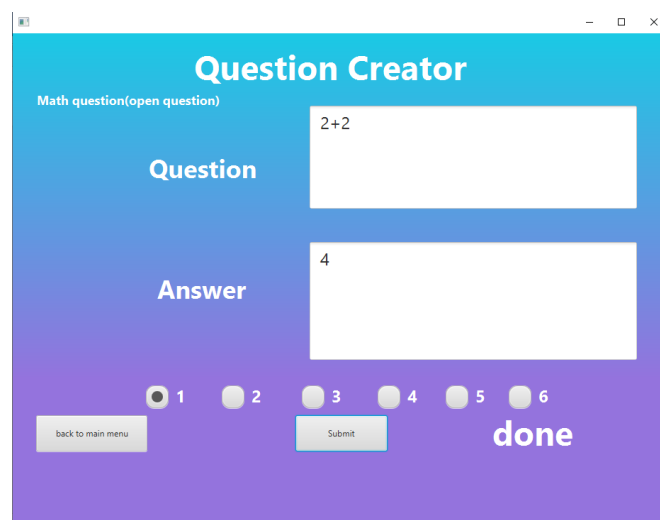

And he must keep putting the questions and its proposed answers, till he reach 10 or more as I have already mentioned previously , otherwise the student won't be able to attempt the questions.

Now if the user (Teacher) choose the other topic (in my case Math topic) , then he will have to do the same as for the Java topic , just in this case , he will put only the questions with the right answer (how it should be the result), because it is an open question, and also at least **10 questions or or more** , and the can put same question more than one time!

The screenshot shows a web application titled "Quiz Creator" with a blue-to-purple gradient background. At the top, there is a "Delete/Update Question" button and two radio buttons for "Java" and "Math". Below this is a "Create a question" button, also with "Java" and "Math" radio buttons, where "Math" is selected. Underneath is a "Create a quiz" button with "Java" and "Math" radio buttons. A row of six difficulty level radio buttons follows: "Very easy" (selected), "Easy", "Medium", "Hard", "Very hard", and "Extreme". At the bottom is a "quit" button.

So, for the math, which is open question, he will put the question after choosing the difficulty level
This way is filling it as the following after clicking on the **Create a question** button:

The screenshot shows the "Question Creator" form. At the top, it says "Math question(open question)". There are two input fields: "Question" containing "2+2" and "Answer" containing "4". Below the input fields are six radio buttons numbered 1 to 6, with radio button 1 selected. At the bottom left is a "back to main menu" button, in the center is a "Submit" button, and at the bottom right is the word "done".

In here, the difficulty levels are represented by numbers (from 1 up to 6 => Easy to Extreme)

So here, **1** represents the very Easy difficulty level.

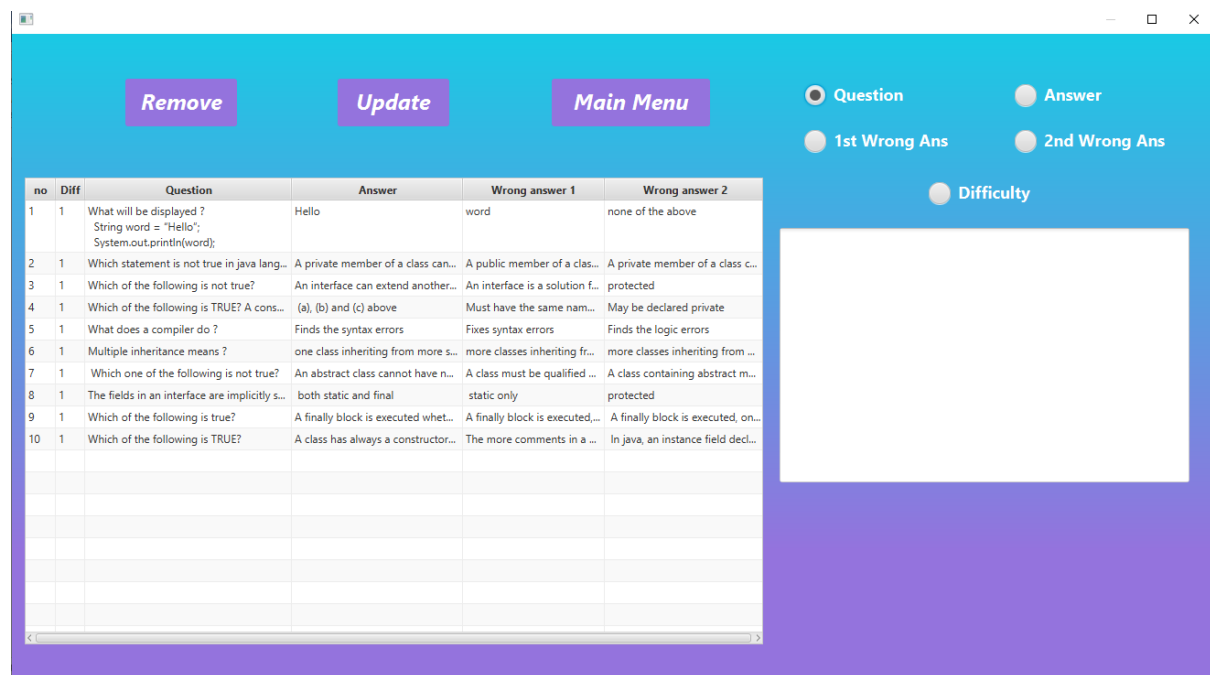

So, the teacher is writing the question and how it should be the answer given by the student. The user (Teacher) must submit at **least 10 or more questions for each difficulty level** otherwise the problem will occur (The Button Create a quiz in the main menu will not take an action and open the questions for the student, so the student won't be able to attempts the questions!!)

When **done** is displayed, that means that the data has been stored successfully in the database, so the user (Teacher) will have to remove the previous question and answer from the textboxes using the backspace key of the keyboard and then put the next question, otherwise , **Try again** will be displayed!

Updating/Deleting

The teacher can update or delete as well, and that can be applied on all, including the answers, questions and even the difficulty levels.

so, he just must choose a topic and click on **Delete/Update Question** button in the main menu and then start whether updating or deleting, as I am showing in the following:

The teacher will choose whether to delete or update, if he wants to delete then, simply he click on his chosen question or answer and then click on the Remove button.

However, if he wants to update then he must click on his chosen question, answer or the difficulty level, and then , he write in the empty text zone the new data he wants put instead, and then click on the update button so it will be stored in the database.

no	Diff	Question	Answer	Wrong answer 1	Wrong answer 2

The Student

STUDENT: Will have to perform the following actions:

1. **Topics Selection:** The student can choose the topic of the quiz based on his interest.
2. **Difficulty Level Selection:** The student can choose the difficulty level from the very Easy up to Extreme difficulty level.
3. **Starting the quiz:** student can commence the quiz
4. **See the results:** The result will be displayed instantly once the student ends the quiz, the grade (score will be /100; 10 points per question) , but if he choose to perform an open question , then his answers will be exported into a pdf file , so then the teacher can evaluate the results of the student's attempts.

First, the student must choose the topic and the difficulty level, and then he will have to click on the  button to start the quiz.

So, in case he chooses the java topic and the very easy difficulty level he will perform the following:

A screenshot of a web application titled "Quiz Creator" with a blue-to-purple gradient background. The interface includes several interactive elements: a "Delete/Update Question" button, three "Create a question" buttons, one "Create a quiz" button, and a "quit" button. There are radio buttons for selecting "Java" or "Math" as the topic, and a row of radio buttons for selecting difficulty levels: "Very easy" (selected), "Easy", "Medium", "Hard", "Very hard", and "Extreme".

Quiz Creator

Delete/Update Question ☐ Java ☐ Math

Create a question ☐ Java ☐ Math

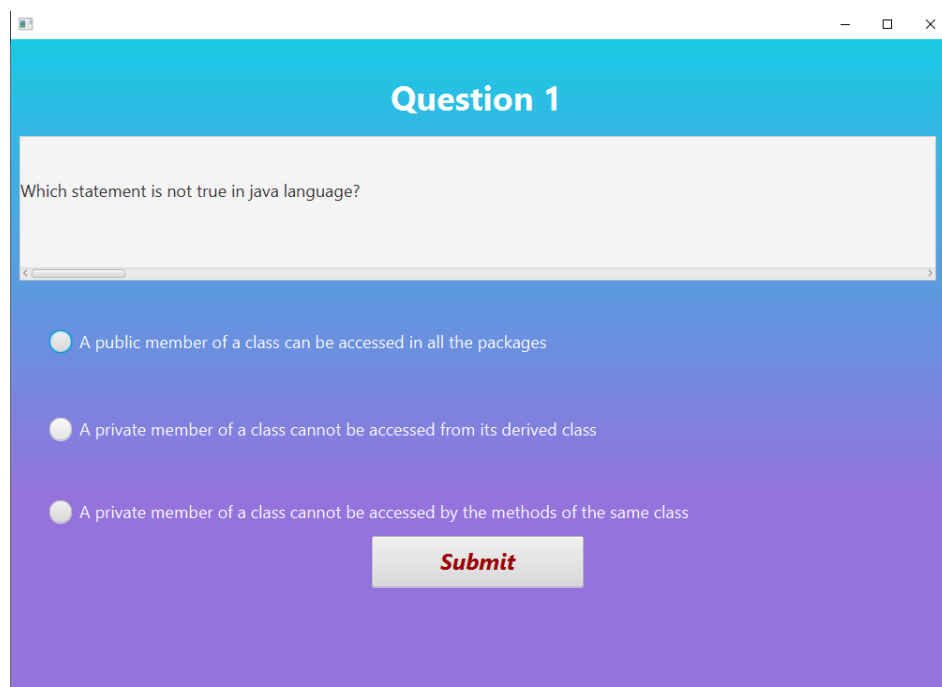

Create a question ☐ Java ☐ Math

Create a quiz ☒ Java ☐ Math

☒ Very easy ☐ Easy ☐ Medium ☐ Hard ☐ Very hard ☐ Extreme

quit

The student will have to answer the MCQ:

The screenshot shows a web application window titled "Question 1". The question text is "Which statement is not true in java language?". Below the question, there are three radio button options. The first option is selected. At the bottom of the question area, there is a "Submit" button.

Question 1

Which statement is not true in java language?

- ☒ A public member of a class can be accessed in all the packages
- ☐ A private member of a class cannot be accessed from its derived class
- ☐ A private member of a class cannot be accessed by the methods of the same class

Submit

Once he click on one of the provided choices and then, he will have submit it by clicking on the **Submit** button and then he will be forwarded to the next question, so a counter will start counting 10 point per a good answer.

Question 2

Which of the following is TRUE?

In java, an instance field declared public generates a compilation error

A class has always a constructor (possibly automatically supplied by the java compiler)

The more comments in a program, the faster the program runs

Submit

-
-
-
-

Question 10

The fields in an interface are implicitly specified as

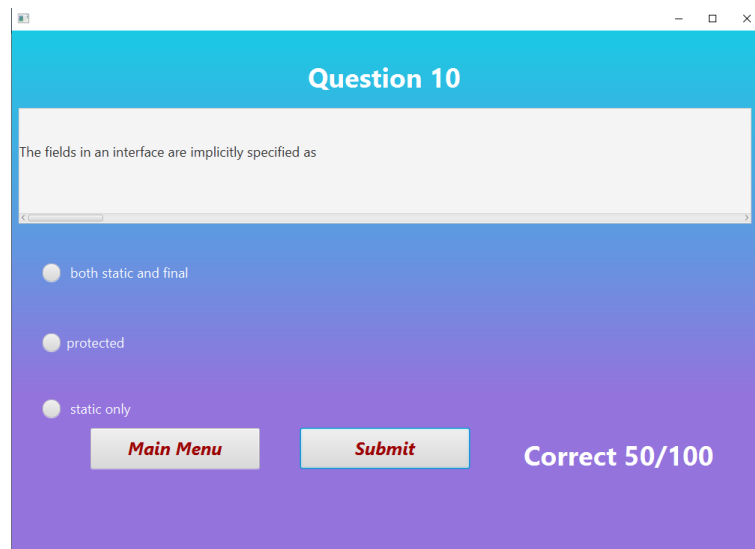

both static and final

protected

static only

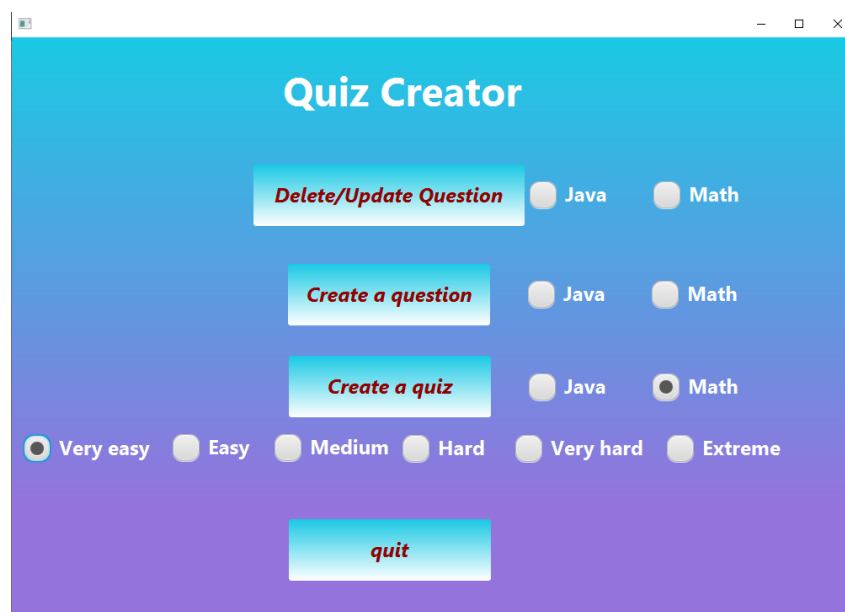

Submit

Now, he will see his result (Score=?): in here it is showing that he answered 5 correct answers out of 10, so the total is 50/100

Now , in case the student choose the math topic which is an open question and the difficulty level and then the **Create a quiz** button, then he will have to write his name on top first and then start answering and submit each one to get forwarded to the next question, so when he finishes, a PDF file will be generated containing the all the questions and his answers, so then the teacher can evaluate them.

As the following:

A screenshot of a web application interface. At the top, a blue header bar contains a white box with the text 'LAFI KAMEL' and the title 'Question 1'. Below the header, a light gray rectangular area displays '0/100' and a horizontal scrollbar. Underneath this is a large white text input field containing the word 'impossible'. At the bottom of the interface, a purple bar features a gray button with the red text 'Submit'.

When clicking  button, he will be forwarded to the next question.

-
-
-

A screenshot of a web application interface for 'Question 10'. The blue header bar shows 'LAFI KAMEL' and 'Question 10'. The light gray area below contains the text 'definir la fonction affine' and a horizontal scrollbar. The white text input field below that contains 'ax+b'. The bottom purple bar contains three elements: a gray button with red text 'Main Menu', a gray button with red text 'Submit', and the word 'done' in white text.

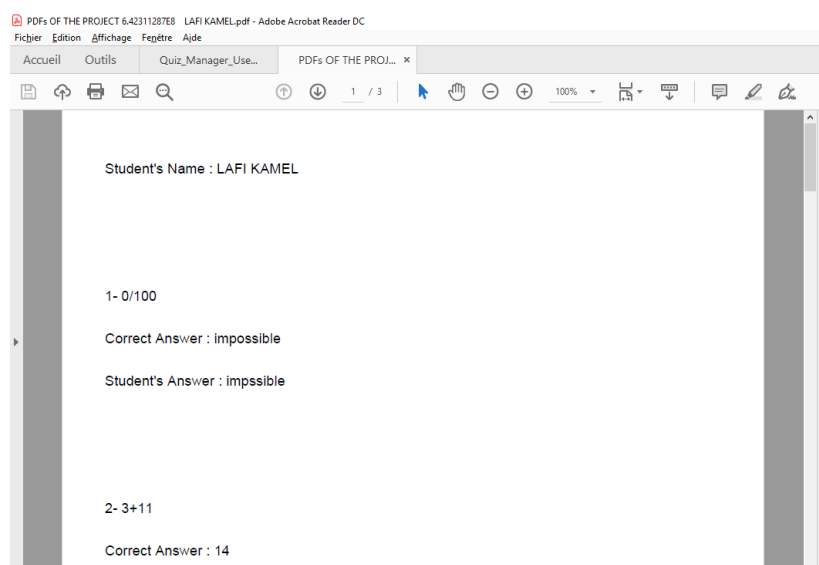

So, once he finishes, a PDF file containing the student's name and all the questions with his answers!

```
/**
 * change the destination of the PDF
 */
PdfWriter.getInstance(doc, new FileOutputStream("d:/PDFs OF THE PROJECT "+tf_name.getText()+".pdf"));
doc.open();
doc.add(new Paragraph("Student's Name : "+tf_name.getText()));
for (int i = 0; i < 10; i++) {
    doc.add(new Paragraph("\n\n\n\n\n"+(i+1)+"- "+Fresh_list.get(i).getContent()+"\n\nCorrect Answer : "+Fresh_list.get(i).getAns()+"\n\nStudent's Answer : "+answers[i]));
}
doc.close();
```

Here, am showing the code, just to the user where he can find his PDF document after he submits, in my case, it was redirected to the destination **d:/** drive as you can see in the code, so the student can change the redirection destination, he is free to change to whatever destination, he will have just to put the destination in the code as you can see just up in the code.

And here there some of that pdf's content:

NB: Please keep in mind that the student cannot attempt the questions if it is not filled by the teacher with 10 questions, and that must be for each and every difficulty level for both topics!!! The teacher fills and then the Student attempts the quiz and get the result.

Please, do send me an E-mail in case you require any further support!
